Abstract

Algorithms 16-23 from the book Nash (1979) are implemented in a variety of programming languages including Fortran, BASIC, Pascal, Python and R. These concern rootfinding, function minimisation and nonlinear least squares.

Overview of this document

This section is repeated for each of the parts of Nashlib documentation.

A companion document **Overview of Nashlib and its Implementations** describes the process and computing environments for the implementation of Nashlib algorithms. This document gives comments and/or details relating to implementations of the algorithms themselves.

Note that some discussion of the reasoning behind certain choices in algorithms or implementations are given in the Overview document.

Algorithm 16 – Grid search

Grid search – establishing a regular pattern of parameter values for one or more arguments of a function and then evaluating that function on the “grid” – is a brute force approach to finding roots, minima, maxima and other features of a function surface. While it cannot be recommended as an efficient method for finding roots or minima, it offers a way to generate data for plotting the function surface and for localizing roots or minima when these are not unique. Furthermore, it is readily understood, and offers a useful starting point in presenting and understanding a problem.

Example output

The driver for presenting the example of the Pascal version of Algorithm 16 is combined with that of Algorithm 17 below.

Algorithm 17 – Minimize a function of one parameter

It is helpful to be able to visualize a one-parameter function before trying to find a minimum. R provides a nice way to do this, and also provides (via the **Brent** method of `optim()`) a way to seek a local minimum, though we need to provide lower and upper bounds. The original Algorithm 17 from Nashlib uses a starting guess and a starting stepsize, which leads to a different approach to finding a minimum. However, the upper and lower bound approach was used in the 1990 Second Edition and its Turbo Pascal variant of the code.

```

cubfn <- function(x) { x*(x*x-2)-5}
curve(cubfn, from=-2, to=2)

```

```
res <- optim(par=0.0, fn=cubfn, method="Brent", lower=c(0), upper=c(1))
cat("Minimum proposed is f(",res$par,")=",res$value,"\n")
```

```
## Minimum proposed is f( 0.8164966 )= -6.088662
```

```

Pascal

Example output

First we compile the codes.

```
fpc ../Pascal2021/dr1617.pas
# copy to run file
mv ../Pascal2021/dr1617 ../Pascal2021/dr1617p.run
```

```
## Free Pascal Compiler version 3.0.4+dfsg-23 [2019/11/25] for x86_64
## Copyright (c) 1993-2017 by Florian Klaempfl and others
## Target OS: Linux for x86-64
## Compiling ../Pascal2021/dr1617.pas
## Linking ../Pascal2021/dr1617
## /usr/bin/ld.bfd: warning: link.res contains output sections; did you forget -T?
## 282 lines compiled, 0.1 sec
```

Then we run the grid search (Algorithm 16) followed by the line search routine (Algorithm 18).

```
../Pascal2021/dr1617p.run <../Pascal2021/dr1617p.in >../Pascal2021/dr1617p.out
```

Algorithm 18 – Roots of a function of one parameter

We use the same cubic polynomial for our rootfinding test as for the 1D minimizer (Algorithm 17). R has a built-in 1D rootfinder, `uniroot`. This uses ideas in Brent (1973). As of UseR!2011 in Warwick, the R multiple-precision package `Rmpfr` (Maechler (2020)) did not have a rootfinder because it needed to have a pure-R code to extend the precision. During a quite period of the conference, the author (JN) translated the C code of `uniroot` to plain R, and it is now the `unirootR` function of `Rmpfr`. The code is in the `rootoned` package at http://download.r-forge.r-project.org/src/contrib/rootoned_2018-8.28.tar.gz.

Note that this is a different algorithm to that in Nashlib. Moreover, even the Nashlib codes are not necessarily fully equivalent, as over time minor variations have crept in. We are also fairly certain that the ideas of Algorithm 18 are NOT the best for performance. They were written initially for the Data General NOVA which had very poor quality floating point (24 bit mantissa, likely no guard digit, no double precision), and with very limited storage. Thus the programming goal was reliability rather than efficiency.

```

cubfn <- function(x) { x*(x*x-2)-5}
## curve(cubfn, from=-2, to=2)
cat("The first attempt fails -- see the plot of the function above.\n")

## The first attempt fails -- see the plot of the function above.

res <- try(uniroot(f=cubfn, lower=0, upper=1))

## Error in uniroot(f = cubfn, lower = 0, upper = 1) :
##   f() values at end points not of opposite sign

res <- try(uniroot(f=cubfn, lower=-3, upper=3))
cat("Root proposed is f(",res$root,")=",res$f.root,"\n")

## Root proposed is f( 2.094555 )= 3.690185e-05

```

```
cat("Tighter tolerance?\n")
```

```
## Tighter tolerance?
```

```
res <- try(uniroot(f=cubfn, lower=-3, upper=3, tol=1e-10))  
cat("Root proposed is f(",res$root,")=",res$f.root,"\n")
```

```
## Root proposed is f( 2.094551 )= -7.01661e-14

BASIC

The code used here was edited from one dated August 30, 1976. Changes were needed to adapt to the changed syntax of the PRINT statement and to allow us to run the program inside a scripted environment, but the logic is unchanged. For example, we have artificially inserted a working set of values to start the Bisection / False Position rootfinder after the grid search. The original program was designed to present the grid search so that the user could interactively choose an interval for which the endpoints had different function values to start the rootfinder.

Listing

Listing

Note that in this routine, we use bisection every 5 function evaluations. That is, we fix the `nbis` variable at 5. This could easily be changed to make it an input quantity.

?? Do we want to discuss why this may be useful?

```
procedure root1d(var lbound, ubound: real;
                var ifn: integer;
                tol : real;
                var noroot: boolean );

var
  nbis: integer;
  b, fb, flow, fup : real;
  notcomp: boolean;

begin
  writeln('alg18.pas -- root of a function of one variable');

  notcomp := false;
  ifn := 2;
  nbis := 5;
  fup := fn1d(ubound, notcomp);
  if notcomp then halt;
  flow := fn1d(lbound, notcomp);
  if notcomp then halt;
  writeln('f(', lbound:8:5, ')=' , flow, '  f(', ubound:8:5, ')=' , fup);
  if fup*flow>0 then noroot := true else noroot := false;
  while (not noroot) and ((ubound-lbound)>tol) do
    begin
      if (nbis * ((ifn - 2) div nbis) = (ifn - 2)) then
        begin

end;

```

Example output

First we compile the codes.

```

fpc ../Pascal2021/dr1618.pas
# copy to run file
mv ../Pascal2021/dr1618 ../Pascal2021/dr1618p.run

```

```

## Free Pascal Compiler version 3.0.4+dfsg-23 [2019/11/25] for x86_64
## Copyright (c) 1993-2017 by Florian Klaempfl and others
## Target OS: Linux for x86-64
## Compiling ../Pascal2021/dr1618.pas
## Linking ../Pascal2021/dr1618
## /usr/bin/ld.bfd: warning: link.res contains output sections; did you forget -T?
## 205 lines compiled, 0.1 sec

```

Then we run the grid search (Algorithm 16) followed by the Bisection / False position routine (Algorithm 18).

```

```

But we can run just the minimizer. Note that above we use only 13 function evaluations in the minimizer, but now use 17 (for the input used in this example). However, the grid search used 11 function evaluations prior to the call to the minimizer for a total of 24.

Algorithm 27 – Hooke and Jeeves pattern search minimization

Example output

We use the Rosenbrock banana-shaped valley problem in 2 dimensions.

```

source("../R/hjn.R")
fminfn <-function(x){
  val<-((x[2]-x[1]^2)^2)*100.0+(1.0-x[1])^2
  val
}
x0<-c(-1.2,1)
cat("Check fn at c(-1.2,1)=",fminfn(x0),"\\n")

```

```
## Check fn at c(-1.2,1)= 24.2
```

```

rslt <- hjn(par=x0, fn=fminfn, control=list(trace=0))
print(rslt)

```

```

## $par
## [1] 1.000001 1.000002
##
## $value
## [1] 6.399999e-13
##
## $counts
## [1] 1996    NA
##
## $convergence
## [1] 0

```

Cleanup of working files

The following script is included to remove files created during compilation or execution of the examples.

```

## remove object and run files
cd ../fortran/
echo `pwd`
rm *.o
rm *.run
rm *.out
cd ../Pascal2021/

```

```

echo `pwd`
rm *.o
rm *.run
rm *.out
cd ../BASIC
echo `pwd`
rm *.out
cd ../Documentation
## ?? others

## /j19z/j19store/versioned/Nash-Compact-Numerical-Methods/fortran
## rm: cannot remove '*.o': No such file or directory
## rm: cannot remove '*.out': No such file or directory
## /j19z/j19store/versioned/Nash-Compact-Numerical-Methods/Pascal2021
## /j19z/j19store/versioned/Nash-Compact-Numerical-Methods/BASIC
## rm: cannot remove '*.out': No such file or directory

```
